change

make uppercase

~

=

swap case

indent

Any motion can follow an operator. Marks and searches count as motions, too! `d/` will delete from the cursor to the next instance of "foo". `y3fi` will yank from the cursor to the 3rd "i" on the line after it. Counts can also come before operators: `5dd` will delete five lines.

SEARCHING				
Prev	Next	Forward	Backward	Matches
N	n	/foo	?foo	foo
		*	#	word under cursor
		tx	Tx	upto x
		fx	Fx	find x

mark-motions			
mm	set mark m (a-z) in file	mM	set mark M (A-Z) across files
'm	jump to first char of line containing m	`m	jump to exact character of m
'	jump back to last jump		

Pass a directory to the :edit command to open a directory explorer. Instructions for usage are at the top of the screen.

ENTERING INSERT MODE

beginning of line	I	before cursor	i	after cursor	a	end of line	A
previous line	O	next line	o	substitute character	s	substitute line	S
						line from cursor	C

ENTERING VISUAL (SELECT) MODE

v	The most basic type. Use Visual mode to select characters within a line.	V	Useful for moving chunks of a program around the file. Use Visual Line mode to select one or more lines.	^V	Great for working with tables made of text, or anything that happens to be conveniently aligned. Visual Block mode can be used to select boxes across lines.
---	--	---	--	----	--

switch cursor to start/end	o	re-select previous area	gv	prepend to each Visual block line	I	jump to start of prior area	'<
----------------------------	---	-------------------------	----	-----------------------------------	---	-----------------------------	----

ZZ	Write current file, if modified, and quit	ZQ	Quit without checking for changes (like :q!)
----	---	----	--

:write Write current file

:wq Write current file and quit

Use :scriptnames to list all files sourced during initialization.

:syntax Enable and configure syntax highlighting Use :sy sync fromstart to redraw broken highlights

:make Run a compiler and enter quickfix

!!	Execute external shell command	!	Filter motion with shell command
----	--------------------------------	---	----------------------------------

Use :earlier and :later to quickly jump backward and forward in a file's history.

:read Read external program output into current file

next character l end of word e beginning of next word w end of WORD E beginning of next WORD W end of line \$

p	paste after cursor	P	paste before cursor	^[return to Normal mode
u	undo	^r	redo	.	repeat
gf	find file under cursor in path and jump to it	dd	delete current line	yy	yank current line
x	delete character after cursor	%	jump to matching paren	r	replace char under cursor
nG	jump to line n	^o	jump back	^i	jump forward
zz	center screen on cursor	zt	align top of screen with cursor	zb	align bottom of screen with cursor
==	auto-indent current line	<<	shift current line left by shiftwidth	>>	shift current line right by shiftwidth

Using ^[] to return to Normal mode lets you keep your fingers on the home row. It's even easier if you map Caps Lock to Control!

COOL INSERT MODE STUFF

^w	delete word before cursor	^u	delete line before cursor
^r	insert the contents of register r	^r=	use the expression register (try ^r=5*10)
^t	increase line indent by shiftwidth	^d	decrease line indent by shiftwidth
^x^l	line completion	^n	find next completion suggestion according to complete

COMMAND-LINE MODE ONLY

edit using Normal mode	^f	insert word under cursor	^r^w	completion suggestions	^d
------------------------	----	--------------------------	------	------------------------	----

Put :noremap %% <C-R>=expand('%:h'). '/' <CR> in your .vimrc so you can type %% in Command-line mode to refer to the directory of the current file, regardless of pwd.

Supply % as a range to the :substitute command to run it on every line in the file.	:%s/Scribble/Design/	"Scribbled" -> "Designed"
Specify the "g" flag to apply the substitution to every match on a line.	:s/[dla]//g	"badly" -> "by"
Vim supports many regular expression features.	:s/..k/ax/	"Mook" -> "Max"
Use \. instead of . if you want to search across multiple lines.	:%s/heat\..*Bungle/anto/	"Cheatsheet\nBungler" -> "Cantor"
Special escapes can be used to change the case of substitutions.	:s_\(f\.\.\)_W\1E_	"foobar" -> "FOObar"
Use :global to perform a command on matching lines.	:g/foobar/delete	Delete all lines containing "foobar"
If your pattern contains slashes, just use a different character as your delimiter.	:s_Data/Lore_Brent_Spiner_	
Use =~ to evaluate expressions with replacement groups.	:s_\d_\=submatch(0) + 1_g	"10 25" -> "21 36"

options

:ls List all open files

:b path Jump to unique file matching path. Use <Tab> to scroll through available completions!

:bn Jump to file n, number from first column of :ls

:bnext Jump to next file

:bprev Jump to previous file

:bdelete Remove file from the buffer list

:edit Open a file for editing

:enew Open a blank new file for editing

:split Split current window horizontally

:vsplit Split current window vertically

^w hjkl Move cursor to window left, below, above or to the right of the current window

^w HJKL Move current window to left, bottom, top, or right of screen

^w r Rotate windows clockwise

^w +-<> Increase/decrease current window height/width

^w T Move current window to a new tab

:only Close all windows except current window

:bufdo Execute a command in each open file

hidden	hid	Lets you switch buffers without saving
laststatus	ls	Show status line never (0), always (2) or with 2+ windows (1)
hlsearch	hls	Highlight search matches. Also see 'highlight'
number	nu	Show line numbers
showcmd	sc	Show commands as you type them
ruler	ru	Show line and column number of the cursor
backspace	bs	Set to '2' to make backspace work like sane editors
wrap		Control line wrapping
background	bg	Set to 'dark' if you have a dark color scheme

REGISTERS are CLIPBOARDS

All commands that delete, copy, or paste text use registers. To change which register is used by a command, type the register before the command. The default register is called "the unnamed register", and it is invoked with a pair of double-quotes (""). Typing dd or yy is the same as typing ""dd or ""yy. Think of the first " as a short way of saying "register", so "" is pronounced "register ", and "a", "register a".

:registers View all current registers

:echo @r Access register r as a variable

"/ Last search pattern register Contains the last pattern you searched for

"_ The black hole register Use this to delete without clobbering any register (!dd)

"0 Last yank register Contains the last text you yanked

"1 Last big delete register Contains the last line(s) you deleted

"2-"9 Big delete register stack Every time "1 is written to, its content is pushed to "2, then "2 to "3, and so on

"_ Small delete register Contains the last text you deleted within a single line

"_+ System clipboard If the OS integration gods smile upon you, this register reads and writes to your system clipboard.

"a-"z Named registers 26 registers for you to play with

"A-"Z Append registers Using upper-case to refer to a register will append to it rather than overwrite it

qr Record Record into register r. Stop recording by hitting q again

@r Playback Execute the contents of register r

@@ Repeat last playback Repeat the last @r, this is particularly useful with a count

vim one-liner used to sort the list of names by length: exe "g"/let @x = len(getline(".")) | normal "xPa " | sort n | g/normal dw

Use a instead of i when beginning text-object motions to include delimiters or surrounding whitespace. For example, di(will change "(foo)" into "()", but da(will delete the parentheses as well.

Use :map to view all current custom key mappings. Read :h map-which-keys for a guide on which keys are best for your own custom mappings. Get used to Vim's help system - it's a fantastic resource!
