of i when

## REGISTERS are CLIPBOARDS

All commands that delete, copy, or paste text use registers. To change which register is used by a command, type the register before the command. The default register is called "the unnamed register", and it is invoked with a pair of double-quotes (""). Typing dd or yy is the same as typing ""dd or ""yy. Think of the first " as a short way of saying "register", so "" is pronounced "register "", and "a, "register a".

		:h registers
:regis	sters	View all current registers
:echo	<b>@r</b>	Access register <b>r</b> as a variable
"/	Last search pattern register	Contains the last pattern you searched for
***	The black hole register	Use this to delete without clobbering any register ("_dd)
"0	Last yank register	Contains the last text you yanked
"1	Last big delete register	Contains the last line(s) you deleted
"2-"9	Big delete register stack	Every time "1 is written to, its content is pushed to "2, then "2 to "3, and so on
"'	Small delete register	Contains the last text you deleted within a single line
"+	System clipboard	If the OS integration gods smile upon you, this register reads and writes to your system clipboard.
"a-"z	Named registers	26 registers for you to play with
"A-"Z	Append registers	Using upper-case to refer to a register will append to it rather than overwrite it
q <b>r</b>	Record	Record into register $\boldsymbol{r}$ . Stop recording by hitting $\boldsymbol{q}$ again
@ <b>r</b>	Playback	Execute the contents of register <i>r</i>
@@	Repeat last playback	Repeat the last $@r$ , this is particularly useful with a count
